

Example Explained - The HTML Page

When a user selects a CD in the dropdown list above, a function called "showCD()" is executed. The function is triggered by the "onchange" event:

EXERCISES ▼

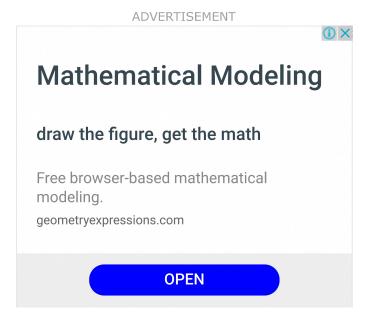

```
ADVERTISED ADVENT
    <script>
   function showCD(str) {
      if (str=="") {
        document.getElementById("txtHint").innerHTML="";
      }
      var xmlhttp=new XMLHttpRequest();
      xmlhttp.onreadystatechange=function() {
        if (this.readyState==4 && this.status==200) {
          document.getElementById("txtHint").innerHTML=this.responseText;
        }
      xmlhttp.open("GET", "getcd.php?q="+str,true);
      xmlhttp.send();
    }
    </script>
    </head>
    <body>
    <form>
    Select a CD:
    <select name="cds" onchange="showCD(this.value)">
      <option value="">Select a CD:</option>
      <option value="Bob Dylan">Bob Dylan
      <option value="Bee Gees">Bee Gees</option>
      <option value="Cat Stevens">Cat Stevens</option>
    </select>
    </form>
    <div id="txtHint"><b>CD info will be listed here...</b></div>
    </body>
    </html>
```

The showCD() function does the following:

- Check if a CD is selected
- Create an XMLHttpRequest object
- Create the function to be executed when the server response is ready
- Send the request off to a file on the server

The PHP File

The page on the server called by the JavaScript above is a PHP file called "getcd.php".

The PHP script loads an XML document, "<u>cd_catalog.xml</u>", runs a query against the XML file, and returns the result as HTML:

```
<?php
$q=$_GET["q"];

$xmlDoc = new DOMDocument();
$xmlDoc->load("cd_catalog.xml");

$x=$xmlDoc->getElementsByTagName('ARTIST');

for ($i=0; $i<=$x->length-1; $i++) {
    //Process only element nodes
    if ($x->item($i)->nodeType==1) {
        if ($x->item($i)->childNodes->item(0)->nodeValue == $q) {
            $y=($x->item($i)->parentNode);
        }
    }
}
```

When the CD query is sent from the JavaScript to the PHP page, the following happens:

- 1. PHP creates an XML DOM object
- 2. Find all <artist> elements that matches the name sent from the JavaScript
- 3. Output the album information (send to the "txtHint" placeholder)
